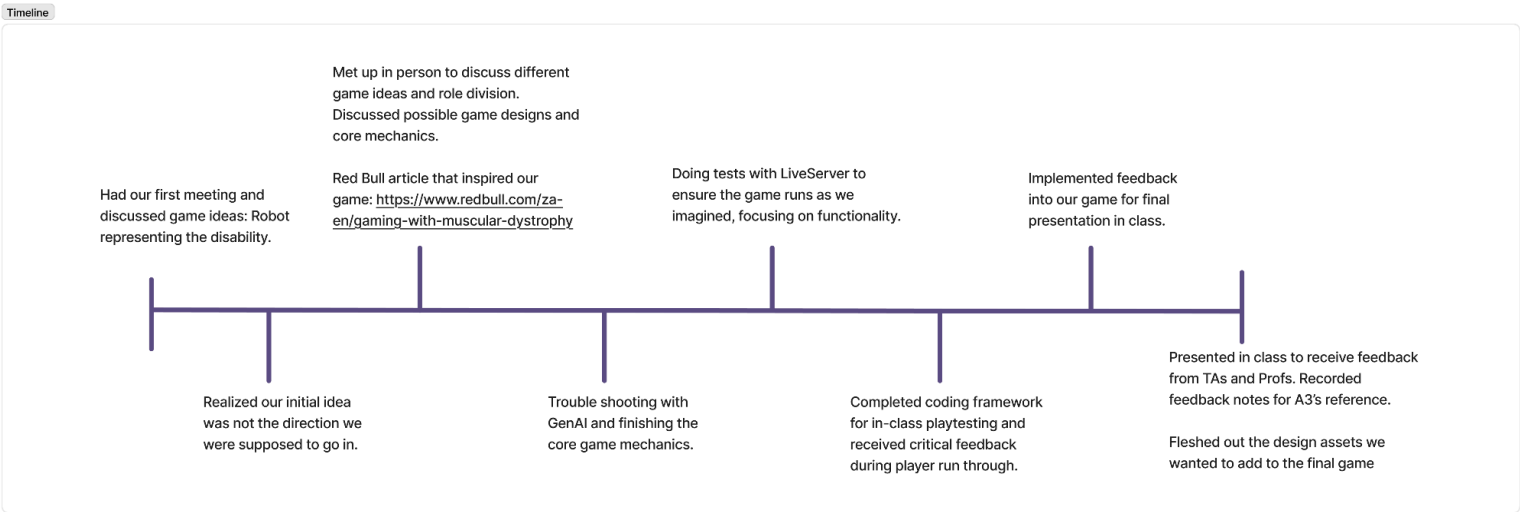
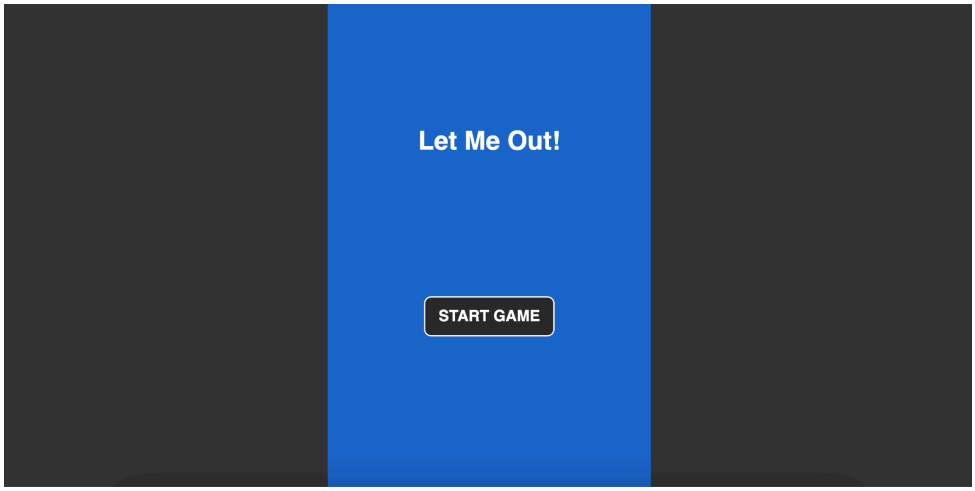
Process Overview Visualization - Timeline

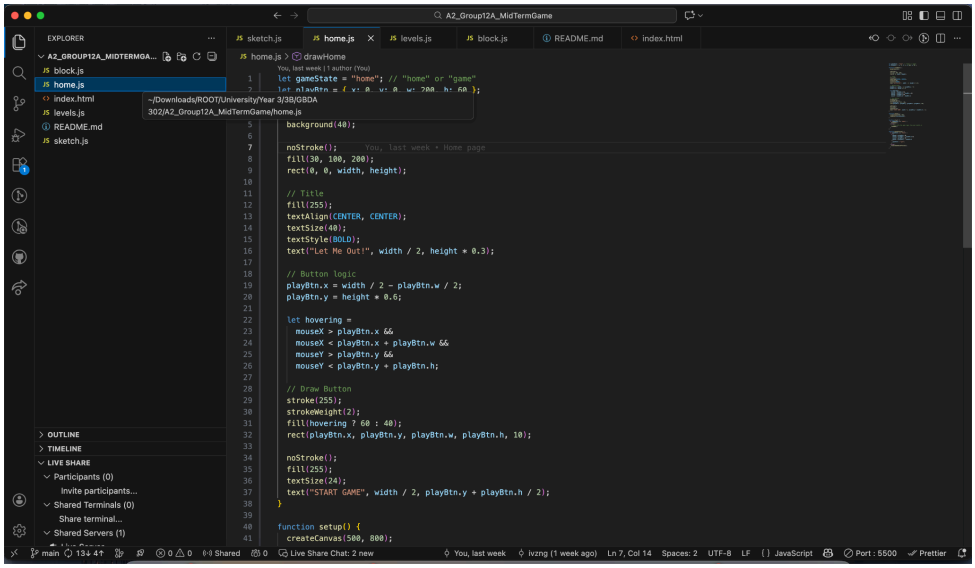
https://www.figma.com/board/UyHW868BsTcDG7OT050FNV/12A_Group12A_MidtermGame_Timeline?node-id=0-1&t=hRx9hcvGpwXsno2g-1



Role Based Evidence

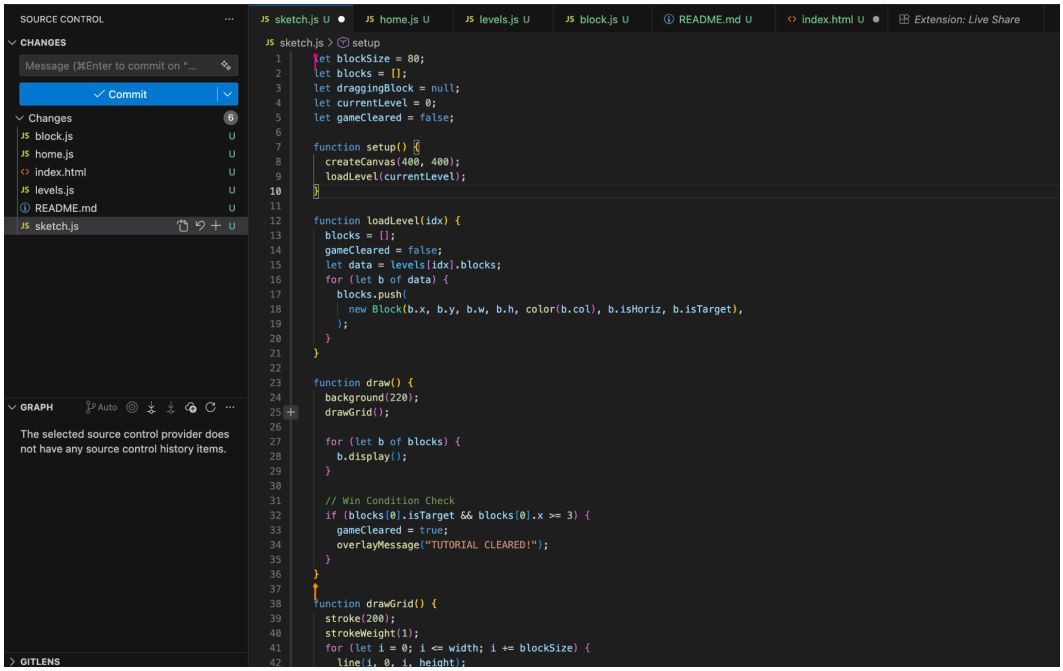
Home page - Ivy

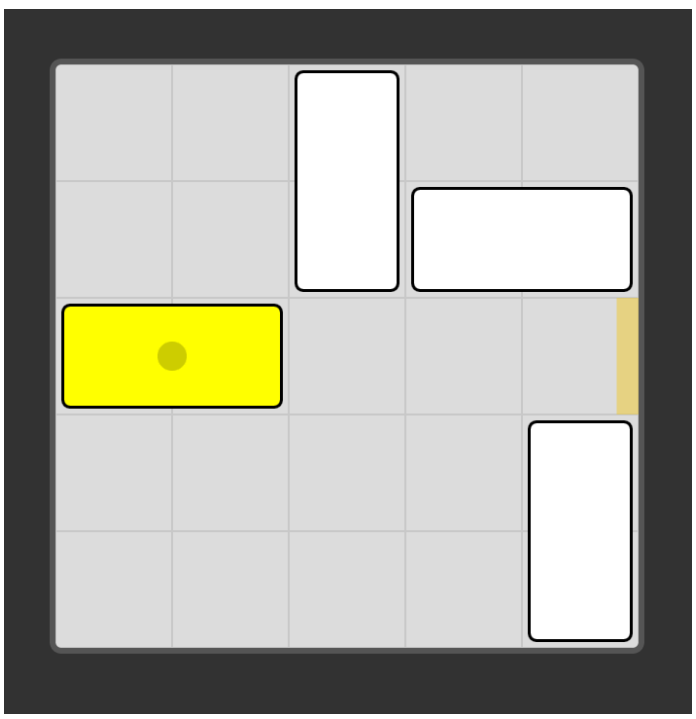




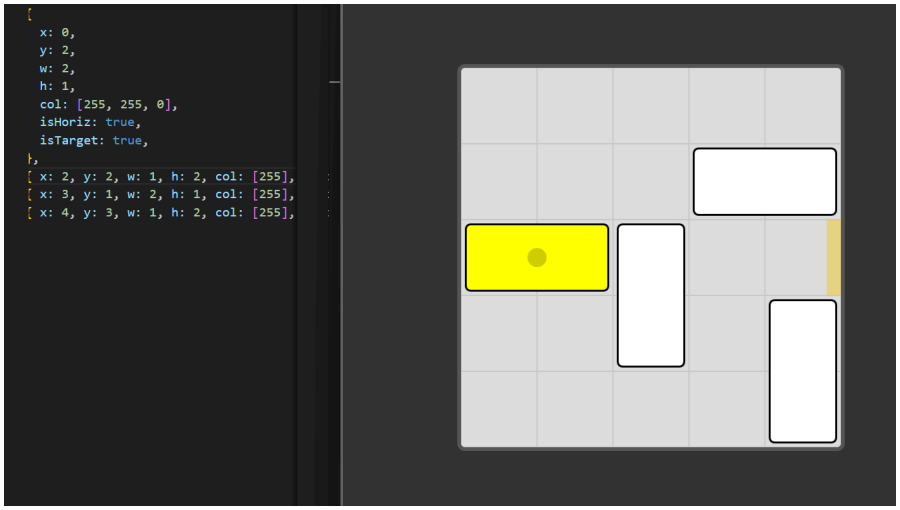
Used GenAI to create the framework of the homepage and went in to make edits that created an interactive button to start the game.

Tutorial Code - Fei Fei



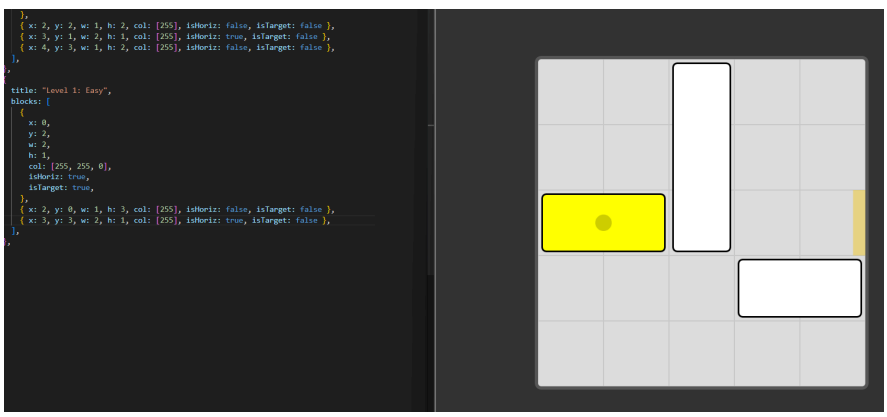


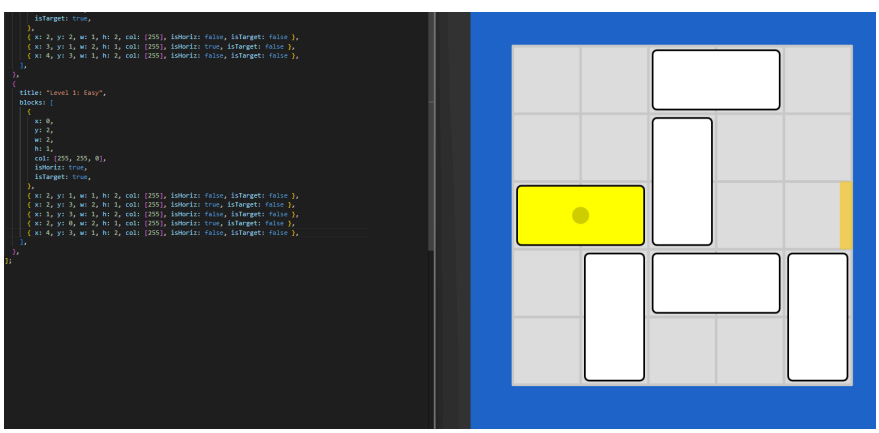
Screenshot of the tutorial in-game before changes were made. The code that was given as a framework from GenAI.



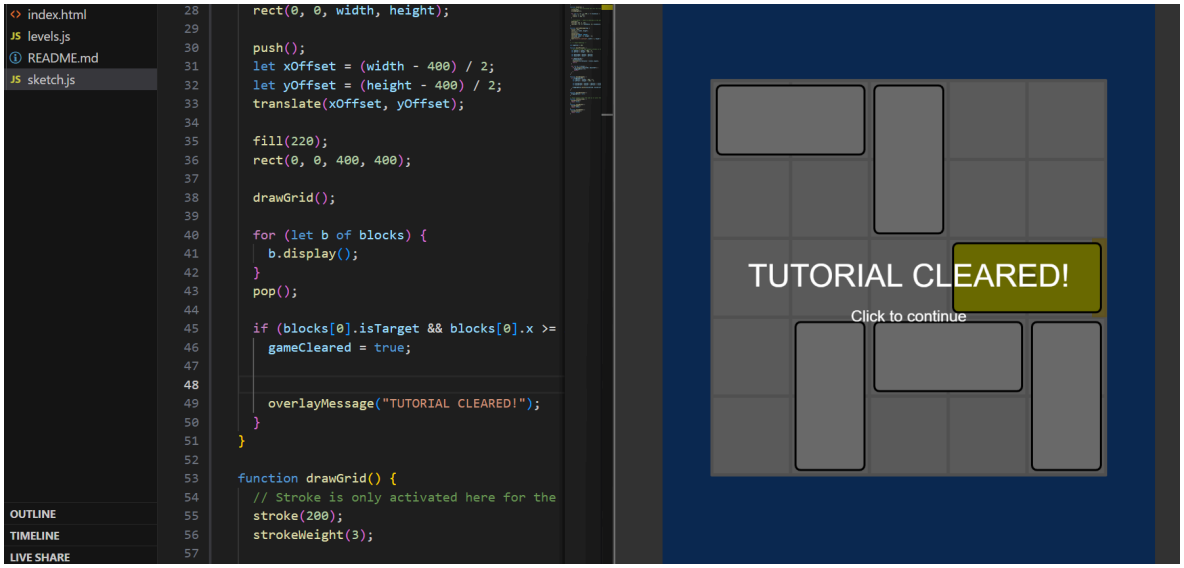
The middle block was moved as an obstacle for players to interact with resulting in the changed *y*-value from 0 to 2.

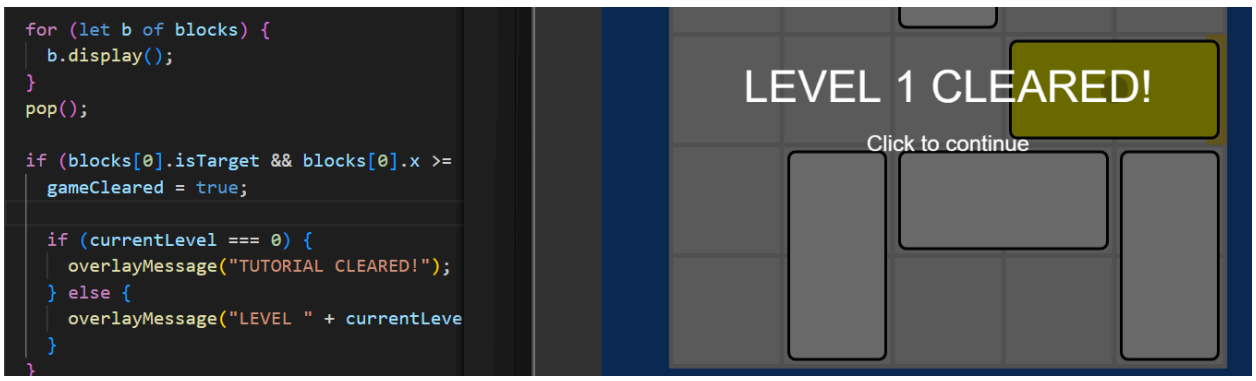
Level 1 Code - Fei Fei



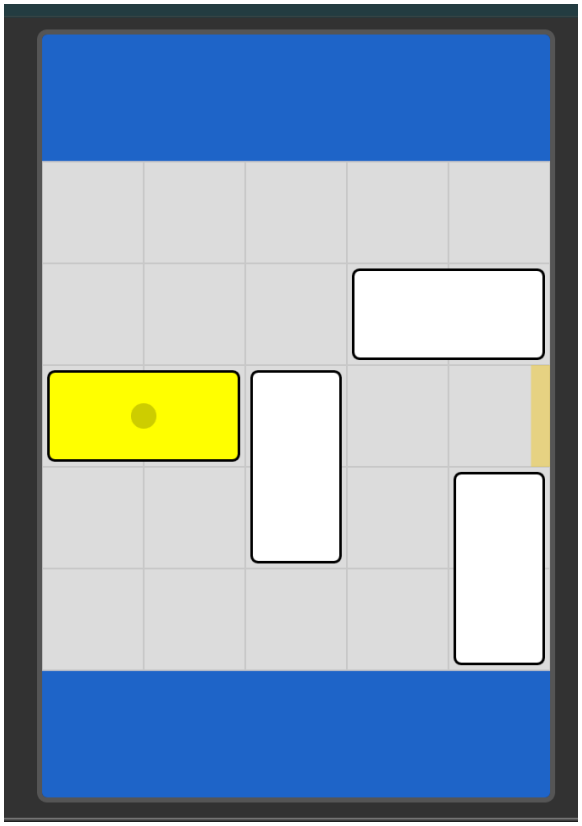


A result of the original code that GenAI had given. We realized it was unsolvable because the blocking obstacle was three squares long. This was edited to add more boxes and shorten all boxes to two squares long.

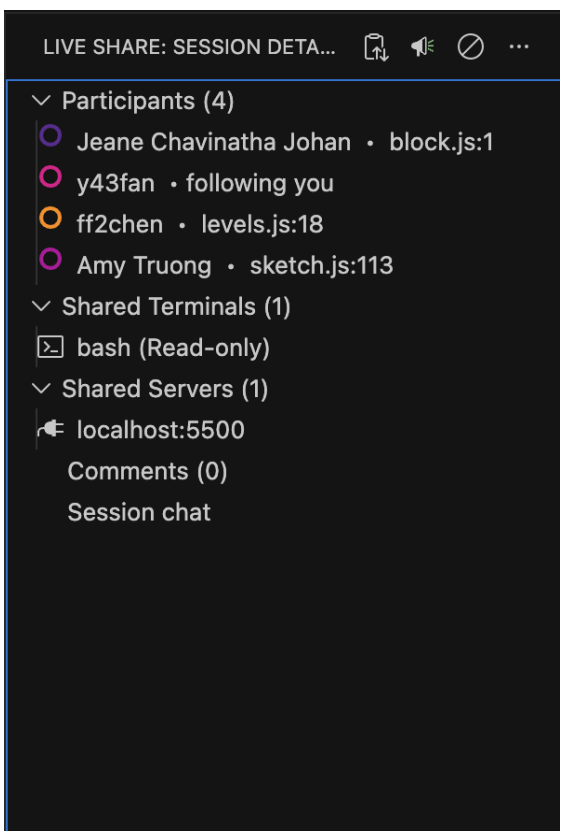




The code that GenAI gave would always prompt “Tutorial Cleared!” even on different levels. This was changed so that after every level, the completion would say the Level number that was cleared.



This was edited to remove the blue outline and made the blue screen wider.



Level 4 & 5 - Jolin

```
JS levels.js > {e} levels
const levels = [    Cannot redeclare block-scoped variable 'levels'.
    blocks: [
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },
      { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    ],
  },
  {
    title: "Level 3: Heavy",
    blocks: [
      {
        x: 0,
        y: 2,
        w: 2,
        h: 1,
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },
      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 1, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
    ],
  },
  const levels = [    Expression or comma expected.

  {
    title: "Level 4: Weak",
    blocks: [
      {
        x: 0,
        y: 2,
        w: 2,
        h: 1,
```

```
const levels = [
    blocks: [
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },
      { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    ],
  },
  {
    title: "Level 3: Heavy",
    blocks: [
      {
        x: 0,
        y: 2,
        w: 2,

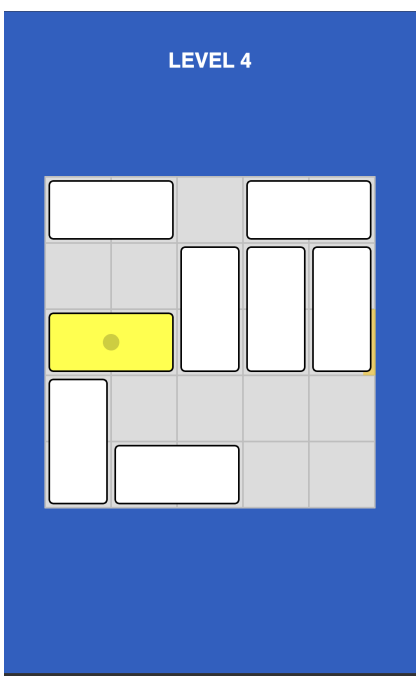
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },
      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 1, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
    ],
  },

  {
    title: "Level 4: Weak",
    blocks: [
      {
        x: 0,
        y: 2,
        w: 2,
        h: 1,
        col: [255, 255, 0],
Ln 81, Col 1   Spaces: 2   UTF-8   LF
```

Redeclared variable, but caused an error and could not load up the file on LiveServer so the variable was removed.



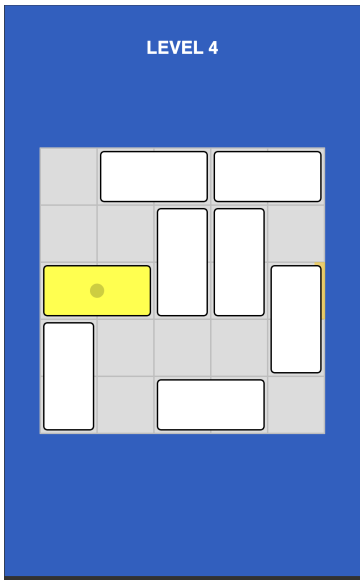
```
  {
    title: "Level 4: Gate Lock",
    blocks: [

      {
        x: 0,
        y: 2,
        w: 2,
        h: 1,
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },

      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

      { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    ],
  },
];
```

The layout before. This was too easy to solve for a level 4 stage.



```
},
{
  title: "Level 4: Weak",
  blocks: [
    {
      x: 0,
      y: 2,
      w: 2,
      h: 1,
      col: [255, 255, 0],
      isHoriz: true,
      isTarget: true,
    },

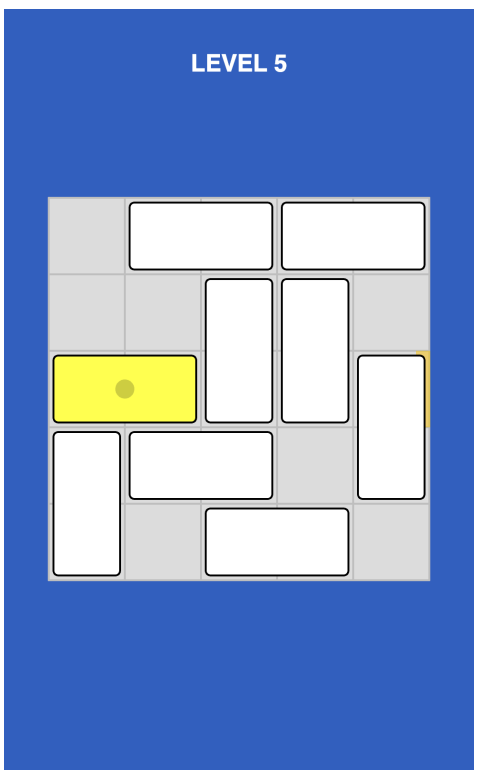
    { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    { x: 4, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

    { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
    { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    { x: 2, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
  ],
},
```

Added more required moves to reach the goal to make it harder than previous levels.



```
ome   JS home.js   <> index.html   JS levels.js ●   README.md   JS sketch.js   JS block.js
JS levels.js > levels > blocks
1    const levels = [
82     blocks: [
100      { x: 2, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
101
102      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
103    ],

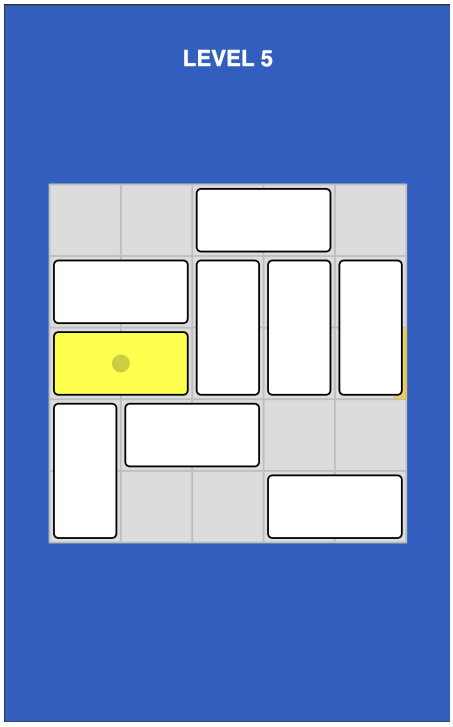
131  },
132  ];
133
Ln 129, Col 80   Spaces: 2   UTF-8   LF   { } JavaScript
```

The layout for level 5 was too easy and very similar to level 4.



```
    blocks: [

      { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

      { x: 2, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    ],
  },
  {
    title: "Level 5: Bottom Lock (Hard)",
    blocks: [
      {
        x: 0,
        y: 2,
        w: 2,
        h: 1,
        col: [255, 255, 0],
        isHoriz: true,
        isTarget: true,
      },

      { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

      { x: 2, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 1, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

      { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    ],
  },
];
```

Ln 127, Col 80 Spaces: 2 UTF-8 LF

More required moves were added as well as roadblocks to make it more challenging. Since it was similar to level 4, the layout was changed for it to be a little different.

```
if (moved) {
  if (currentLevel === 2) this.cooldownUntil = frameCount + 15;
  if (currentLevel === 3) this.cooldownUntil = frameCount + 20;
}
```

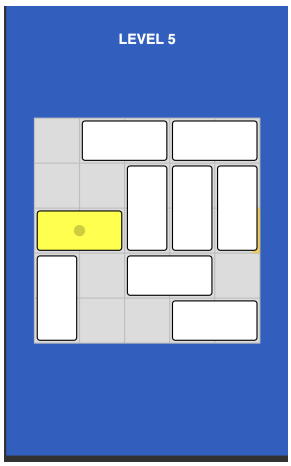
Before: Only added stutter to levels 2 & 3

```
if (moved) {
  if (currentLevel === 2) this.cooldownUntil = frameCount + 15;
  if (currentLevel === 3) this.cooldownUntil = frameCount + 20;
  if (currentLevel === 4) this.cooldownUntil = frameCount + 25;
  if (currentLevel === 5) this.cooldownUntil = frameCount + 30;
}
}
```

Before: The values made too little of a difference to be noticed by the player

```
if (moved) {
  if (currentLevel === 2) this.cooldownUntil = frameCount + 15;
  if (currentLevel === 3) this.cooldownUntil = frameCount + 20;
  if (currentLevel === 4) this.cooldownUntil = frameCount + 30;
  if (currentLevel === 5) this.cooldownUntil = frameCount + 40;
}
}
```

After: Added stutter and increased the value for more effect in levels 4 & 5



```
{
  title: "Level 5: Double-Detour (Hard)",
  blocks: [
    {
      x: 0,
      y: 2,
      w: 2,
      h: 1,
      col: [255, 255, 0],
      isHoriz: true,
      isTarget: true,
    },

    { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
    { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

    { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
    { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

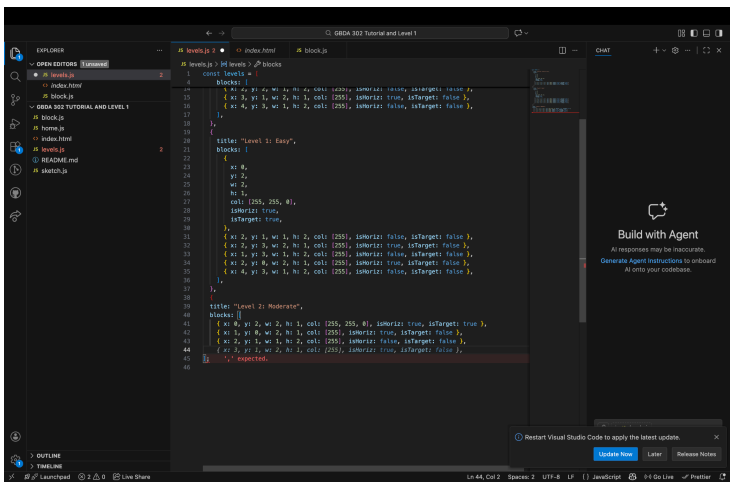
    { x: 2, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

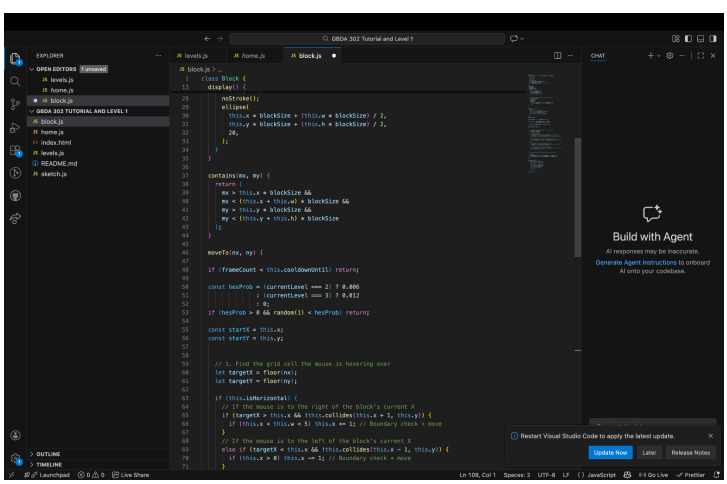
    { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
  ],
},
];
```

Final: Made level 5 harder, included detours, roadblocks, and more moves needed to complete the level.

Level 2 & 3 - Jeane



Configured layout for a slightly harder level that differentiated from the previous level.



Added logic for heavier drag by increasing frame rate before action is fully completed and added function to increase difficulty in levels.

Group 12A A2: Midterm Game Showcase

Names:

Yukie Fan
Ivy Zhang
Fei Fei Chen
Jeane Chavinatha Johan
Jolin Li
Amy Truong

Role(s):

Coders:

- Homepage: Ivy
- Tutorial and Level 1: Fei Fei
- Level 2 and 3: Jeane
- Level 4 and 5: Jolin

Process and Decision Documentation:

- Yukie and Amy
- Everyone contributed to the GenAI Documentation and Role Based Evidence

Primary responsibility for this work:

Collaborating to create a skeleton of a game with the disability of muscular dystrophy in mind. Focusing on game mechanics to allow critical feedback during playtesting.

Goal of Work Session

The goal for this work session was to create an entertaining game with the disability of muscular dystrophy in mind. This game should be accessible to any audience while educating others on the disability. For the playtesting, the game should be 70-80% finished, focusing on game mechanics rather than visuals and audio. We wanted to design the basic mechanics and determine the players goal in the game for the playtesting showcase. Visuals and audio have not been thought of yet as we focused on how the game would be both entertaining and subtly educating.

Tools, Resources, or Inputs Used

For this assignment, we used different GenAI tools (i.e. Google Gemini, Copilot, ChatGPT, etc.) to help us formulate our code and give us a framework of how the game should work. It allowed us to build on top of its code based on the idea of the game we wanted to create. With the AI-given code, we had to go

through lots of trial and error since there would be some parts that were not how we imagined our game to be. We also asked other groups on their interpretation of the instructions to get a clearer understanding of our objective as well as the type of game we need to be making. This clarity allowed us to revisit our brainstorming ideas. We also used a Red Bull article [1] that spoke on games that were entertaining but also playable by people with muscular dystrophy. From there, we were able to formulate ideas and draw inspiration from different games.

GenAI Documentation

Date Used:	March 3, 2026
Tool Disclosure:	Google Gemini
Purpose of Use:	Brainstorming + starter code generation
Summary of Interaction:	Generated a basic 5×5 sliding-block ("unblocking") tutorial level in p5.js with drag + touch support and a win condition.
Human Decision Point:	We reviewed the level layout and mechanics and adjusted visuals/controls to match our project style (mobile layout, centered board). We did not rely on its "always solvable" claim without testing.
Integrity & Verification Note:	We manually playtested the level to confirm it could be solved and that collision/movement rules matched the course goal (clear mechanics, no bypass).
Scope of GenAI Use:	GenAI did not design our final game concept, difficulty progression, or representation rationale; it only helped with a starting implementation.
Limitations or Misfires:	The prompt asked for blocks that move freely in 4 directions, but the AI recommended axis-locked movement (more correct for this genre). It also could not truly guarantee solvability.

Date Used:	March 3, 2026
Tool Disclosure:	Google Gemini
Purpose of Use:	Debugging / collision-movement logic
Summary of Interaction:	Proposed changing drag-to-grid logic so blocks move one grid step at a time, preventing skipping over other blocks and tightening collision checks.

Human Decision Point:	We tested the proposed fix and adjusted it to fit our centered board offsets and input mapping. We kept step-by-step movement because it prevented bypassing the puzzle.
Integrity & Verification Note:	We verified by repeatedly attempting to “cheat” (dragging quickly across occupied squares) and confirmed blocks stop correctly when blocked.
Scope of GenAI Use:	GenAI did not decide how difficulty represents muscular dystrophy; it only helped fix a mechanical bug that broke the core puzzle rules.
Limitations or Misfires:	The AI’s fix didn’t automatically account for our translated/centered grid, so we had to correct mouse coordinate offsets ourselves.

Date Used:	March 3, 2026
Tool Disclosure:	Google Gemini
Purpose of Use:	UI/layout troubleshooting + CSS support
Summary of Interaction:	Helped calculate offsets to center the 400×400 board and suggested CSS + draw-state resets (push/pop, noStroke) to remove an unwanted border/outline.
Human Decision Point:	We implemented the centering math but had to update all input functions (mousePressed/Dragged) to match offsets; otherwise controls were inaccurate.
Integrity & Verification Note:	We checked visually (board centered on different window sizes) and interactively (dragging matched block positions; no visual artifacts).
Scope of GenAI Use:	GenAI did not design our UI aesthetic; we chose the mobile framing and visual style.
Limitations or Misfires:	Some outline explanations were speculative; we confirmed the true cause by checking CSS and testing changes incrementally.

Date Used:	March 3, 2026
Tool Disclosure:	Google Gemini

Purpose of Use:	Wording + UI placement guidance
Summary of Interaction:	Suggested adding conditional tutorial instructions in **draw()** only when currentLevel === 0 and not cleared, placed in the blue UI area.
Human Decision Point:	We edited the wording and placement to match our tone and ensure it didn't overlap win overlays.
Integrity & Verification Note:	We tested that instructions appear only in the tutorial, disappear on completion, and do not interfere with gameplay.
Scope of GenAI Use:	GenAI did not write our README/process documentation; it only supported a small UI feature.
Limitations or Misfires:	Needed small adjustments based on our canvas sizing and layout.

Date Used:	March 3, 2026
Tool Disclosure:	Google Gemini
Purpose of Use:	Level-structure guidance / implementation support
Summary of Interaction:	Explained how to add another level object to the levels array and what each parameter means (x/y, w/h, isHoriz, isTarget).
Human Decision Point:	We designed the actual layouts ourselves and tested solvability rather than copying the example blindly.
Integrity & Verification Note:	We playtested each new level to ensure it's solvable and that difficulty increases through puzzle complexity, not unfair mechanics.
Scope of GenAI Use:	GenAI did not create our final level progression or difficulty mapping to muscular dystrophy; we controlled that design decision.
Limitations or Misfires:	The example level was generic and not guaranteed solvable; we treated it as a template only.

Date Used:	March 3, 2026

Tool Disclosure:	Google Gemini
Purpose of Use:	Implementation support (UI button + game state navigation)
Summary of Interaction:	Provided code to add a ‘play’ button on the home screen, detect clicks, and switch gamesTATE from “home” to “game” so the tutorial loads. Also suggested separating logic into home.js and renaming functions to avoid conflicts.
Human Decision Point:	We adapted the approach to fit our existing file structure and chose how to manage function renaming (e.g., whether to keep one draw loop with a state switch or split files). We also adjusted button styling/placement to match our UI.
Integrity & Verification Note:	We tested the button on desktop and touch input to confirm it reliably transitions to the tutorial and does not break game input handling or level loading.
Scope of GenAI Use:	GenAI did not design our home screen aesthetic, title text, or game concept; it only helped implement navigation/UI interaction.
Limitations or Misfires:	The response assumed specific functions existed (e.g., runGame(), handleGameMousePressed()) and required manual refactoring to match our actual codebase and avoid duplicate setup() or draw() conflicts.

Date Used:	March 4, 2026
Tool Disclosure:	ChatGPT 5.2
Purpose of Use:	Level design support + mechanic tuning (difficulty scaling)
Summary of Interaction:	Generated a proposed Level 2 block layout in {x,y,w,h,horizontal,isTarget} format, a step-by-step solution path (6 moves), and suggested tuning values for heavier movement (dragFactor, stutterProb). Also advised how to integrate the level by swapping configurations in the level-loading function rather than rewriting the whole project.
Human Decision Point:	We reviewed the layout for clarity and fairness,

	adjusted block positions as needed, and confirmed the level felt “tight but readable.” We also decided whether to include hesitation at all (and if so, kept it subtle) to avoid the game feeling glitchy or disrespectful.
Integrity & Verification Note:	We verified solvability by manually solving the level from the starting state and testing alternative moves to check for accidental deadlocks. We also checked that the “heavier” feel came from consistent friction settings (not random failure) and fit the course’s representation goals.
Scope of GenAI Use:	GenAI did not create our final difficulty progression, codebase structure, or representation rationale; it only provided a draft Level 2 layout and parameter suggestions that we tested and modified.
Limitations or Misfires:	The AI could not truly prove “no dead ends” across all possible player moves; we had to playtest and iterate. It also assumed our code already supported dragFactor/stutterProb, so we needed to implement or adapt those mechanics ourselves.

Date Used:	March 6, 2026
Tool Disclosure:	ChatGPT 5.2
Purpose of Use:	Level design assistance and difficulty balancing
Summary of Interaction:	The tool generated a revised Level 2 configuration with more blocks to increase puzzle complexity while remaining solvable. It also included a suggested solution path to demonstrate that the puzzle could be completed and provided optional ideas for making the blocks feel slightly heavier to move as difficulty increases.
Human Decision Point:	We reviewed the suggested layout and adjusted block placements where necessary to ensure the puzzle still felt clear and fair. We also decided which parts of the difficulty suggestions fit our game and removed or modified elements that felt too random or distracting.
Integrity & Verification Note:	We manually tested the level multiple times to

	confirm it was solvable and that the added blocks increased difficulty through planning rather than confusion. We also checked that the puzzle could not be bypassed or solved accidentally without following the intended logic.
Scope of GenAI Use:	GenAI only contributed a draft layout and suggestions for increasing difficulty. The final level design, puzzle tuning, and integration into the project were completed by our group.
Limitations or Misfires:	The tool could not guarantee that the level was perfectly balanced or free of unintended solutions, so we relied on playtesting and adjustments to confirm the puzzle worked as intended.

Date Used:	March 6, 2026
Tool Disclosure:	ChatGPT 5.2
Purpose of Use:	Level design support for a later puzzle level
Summary of Interaction:	The tool generated a proposed Level 4 layout, a step-by-step solution path, confirmation that the level was intended to avoid irreversible deadlocks, and suggested settings for increased movement resistance and hesitation.
Human Decision Point:	We reviewed the layout and decided whether the puzzle felt clear enough for players to understand. We also evaluated whether the suggested movement changes matched our goal of making the level feel heavier without becoming frustrating or unclear.
Integrity & Verification Note:	We checked the level by manually following the proposed solution and testing other moves to make sure the puzzle still felt fair and solvable. We also compared the design against the assignment goals so the challenge came from planning and effort, not randomness.
Scope of GenAI Use:	GenAI only provided a draft Level 4 structure and tuning suggestions. Our group was responsible for deciding whether to keep, modify, or reject the layout and how it fit into the overall progression of the game.
Limitations or Misfires:	The tool could suggest a solution path, but it could

	not fully guarantee the absence of all unintended solutions or dead ends without manual testing.

Summary of Process (Human + Tool)

Our process involved several rounds of brainstorming, discussion, and revision as we worked toward a concept that fit both the assignment requirements and our group's goals. We began by discussing different ways a game could represent muscular dystrophy, which led to our first idea involving a robot completing daily tasks using a stamina bar. As we talked through how that concept would work in gameplay, we started to question whether it framed the disability appropriately and whether it felt more like a simulation than an engaging game. This led to further discussion within the group and a decision to move away from the storyline approach and explore simpler mechanics.

From there, we experimented with different puzzle-style ideas that could be easy to understand and play. One teammate suggested using sliding mechanics similar to puzzle games like Candy Crush, which sparked a series of discussions about how blocks could move and what the main objective of the game should be. Through these conversations, the idea of a block escape puzzle gradually developed, where the player would slide blocks out of the way to free a target block. As we refined this idea, we also discussed how the mechanics could connect to muscular dystrophy, which led to the decision to gradually make blocks harder to move as levels progressed.

During development and testing, we continued to refine the mechanics and identify issues. While testing the game, we discovered a glitch that allowed the player to jump over blocks and reach the end without solving the puzzle. This moment showed us that some of the mechanics were not behaving the way we intended. We revisited the code, discussed how the movement system should work, and made adjustments so that players would have to solve the puzzle properly instead of bypassing it. Overall, our process involved multiple iterations, open discussion among teammates, and testing that helped us refine both the concept and the gameplay mechanics.

Our in-class playtesting also played an important role in shaping the game. Many peers were able to move through the early levels quickly and without much explanation, which confirmed that the basic mechanics were clear and intuitive. Players generally said they liked the core puzzle mechanics and overall game composition. However, the playtesting also revealed areas where the experience could be improved. Some players suggested making the tutorial instructions larger and clearer, since they were easy to miss. Others experienced confusion with the movement controls, particularly when swiping or tapping blocks, and sometimes blocks moved farther or in a different direction than intended. Some peers suggested alternative control methods, such as clicking on a specific side of a block to indicate direction, or making swipe gestures more explicit. We also received visual suggestions, such as making the blocks darker to better communicate the idea of "heaviness" and adjusting the block shapes to make their direction clearer. Additionally, some players did not immediately notice that the blocks were supposed to become harder to move over time, which showed us that this mechanic could be communicated more clearly. Overall, the combination of internal testing, peer feedback, and discussion helped us refine both the gameplay mechanics and the clarity of the player experience.

Decision Points & Trade-offs

During our first meeting to discuss the direction we wanted our game to go in, we came up with a couple game ideas and worked to understand what our disability really meant. From this meeting, we thought of creating a game that included a character who represented our disability. It was supposed to be a robot who would go around managing tasks with a decreasing stamina bar. However, upon further consultation with another group who met with the professor, we realized this idea was not the right direction. Thus, we had to change our idea. When looking for inspiration, we found a Red Bull article that mentioned games like Candy Crush or games with simple and minimal mechanics. This allowed us to think of similar games we had played in the past. After pinpointing the idea we wanted to create, we had GenAI create a prototype to see if our game idea was really possible. The code that GenAI gave us had many flaws, but it was in the general genre we were going for, so we used it as the framework for our game. With the game idea solidified, we were able to split our roles and determine the core mechanics of the game for the midterm showcase. Some affordances we noticed in our game after playtesting were the movement of our blocks and the decreasing speed as the levels increase. Players initially thought the blocks moved by tapping on the blocks (left or right depending on desired direction) whereas we wanted the players to only move by swiping or dragging the blocks. Another affordance we noticed during playtesting was our blocks' lack of decreasing speed. The difference between the levels was not great enough thus, it had to be adjusted after receiving the feedback from playtesting. Players did not notice the change as the levels got harder and we had to explain to them during playtesting the concept of slowing down the movement of the blocks.

Verification & Judgement

We evaluated whether this change was appropriate mainly through group discussion and by revisiting the assignment criteria. As we talked through our earlier ideas, we realized the robot storyline framed disability in a way that felt negative and more like a simulation than a game. After re-reading the assignment prompt and reflecting on the course discussions about respectful representation, we agreed that the concept should focus on engaging gameplay rather than directly simulating a person with muscular dystrophy. We also considered the ethical implications of how disability is represented, making sure the game would not portray muscular dystrophy as failure or punishment. Through this process, we felt that the sliding puzzle idea with blocks becoming harder to move better captured the idea of increasing effort while still keeping the game simple, accessible, and enjoyable to play.

We also used feedback from in-class playtesting to evaluate whether our design decisions were working as intended. Many peers were able to complete the early levels quickly and without needing much clarification, which suggested that the core mechanics were easy to understand and accessible. Players generally responded positively to the puzzle format and said they enjoyed the game composition and mechanics. However, playtesting also revealed several areas for improvement. Some players mentioned that the tutorial instructions were not very noticeable, so we plan to make them larger and clearer. Others experienced confusion with the movement controls, particularly when swiping or tapping blocks. In some cases, blocks moved farther than the player intended or in the opposite direction, which made the controls feel less predictable. A few players also suggested alternative control methods, such as clicking on a specific side of a block to indicate direction or making swipe gestures more explicit. Visually, one player suggested using darker blocks to better communicate the idea of "heaviness," and another recommended

slightly changing the block shape so the front is more pointed, making the intended movement direction clearer. Finally, some players did not immediately notice that the blocks were meant to become harder to move over time, which indicated that this mechanic could be communicated more clearly through visual or interaction cues. These observations helped us confirm that the overall concept was working, while also giving us specific changes to improve clarity, controls, and representation before the final showcase.

Appendix

Fei Fei, Gemini, Tutorial

What I Gave AI:

Make a 5x5 grid, the grid will have a yellow block that takes up two boxes and has the goal to exit the grid, the player needs to move the other blocks that are white with a black outline to let the yellow block slide out of the grid to successfully pass the level. As a starter, use 3 white blocks that are two blocks wide and make it a very simple level. The blocks should be able to be moved up, down, left and right, they should be placed vertically or horizontally randomly. With it being able to be played touchscreen and using the mousepad. Ensure the code is written in p5.js. The game should always be solvable with the player always being able get the yellow block to slide out.

What AI Gave Me:

This is a classic "sliding block" puzzle (often known as Rush Hour). To make this work in p5.js, we need to define a grid system where blocks occupy specific coordinates and can only slide along their axis (horizontal or vertical).
In this starter level, the Yellow Block is horizontal and needs to reach the right edge of the 5×5 grid.

The Game Logic

- The Grid: A 5×5 space where each cell is 80×80 pixels.
- The Goal: Move the Yellow Block to the exit (right side).
- Movement: Blocks only slide along their orientation. They stop if they hit a wall or another block.

p5.js Implementation

JavaScript
```
let blockSize = 80;
let blocks = [];
let draggingBlock = null;
let offsetX, offsetY;

function setup() {
```

```
  createCanvas(400, 400);

  // 1. The Yellow Block (Goal: Reach the right exit)
  // x, y, width(in cells), height(in cells), color, isHorizontal
  blocks.push(new Block(0, 2, 2, 1, color(255, 255, 0), true, true));

  // 2. Three White Starter Blocks (Strategic but simple placement)
  blocks.push(new Block(2, 0, 1, 2, color(255), false, false)); // Vertical
  blocks.push(new Block(3, 1, 2, 1, color(255), true, false));  // Horizontal
  blocks.push(new Block(4, 3, 1, 2, color(255), false, false)); // Vertical
}

function draw() {
  background(220);
  drawGrid();

  for (let b of blocks) {
    b.display();
  }

  // Check for Win Condition
  if (blocks[0].x >= 3) {
    fill(0, 150, 0);
    textSize(32);
    textAlign(CENTER, CENTER);
    text("LEVEL CLEARED!", width/2, height/2);
  }
}

function drawGrid() {
  stroke(200);
  for (let i = 0; i <= width; i += blockSize) {
    line(i, 0, i, height);
    line(0, i, width, i);
  }
  // Exit Marker
  noStroke();
  fill(255, 200, 0, 100);
  rect(width - 10, 2 * blockSize, 10, blockSize);
}

class Block {
  constructor(x, y, w, h, col, isHorizontal, isTarget) {
    this.x = x; // Grid units
```

```
  this.y = y;
  this.w = w;
  this.h = h;
  this.col = col;
  this.isHorizontal = isHorizontal;
  this.isTarget = isTarget;
}

display() {
  stroke(0);
  strokeWeight(2);
  fill(this.col);
  rect(this.x * blockSize + 5, this.y * blockSize + 5,
       this.w * blockSize - 10, this.h * blockSize - 10, 5);
}

contains(mx, my) {
  return (mx > this.x * blockSize && mx < (this.x + this.w) * blockSize &&
          my > this.y * blockSize && my < (this.y + this.h) * blockSize);
}

moveTo(nx, ny) {
  // Round to nearest grid slot
  let targetX = round(nx);
  let targetY = round(ny);

  // Boundary checks
  targetX = constrain(targetX, 0, 5 - this.w);
  targetY = constrain(targetY, 0, 5 - this.h);

  // Collision detection with other blocks
  if (!this.collides(targetX, targetY)) {
    this.x = targetX;
    this.y = targetY;
  }
}

collides(tx, ty) {
  for (let other of blocks) {
    if (other === this) continue;
    if (tx < other.x + other.w && tx + this.w > other.x &&
        ty < other.y + other.h && ty + this.h > other.y) {
      return true;
    }
```

```
    }
    return false;
  }
}

function mousePressed() {
  for (let b of blocks) {
    if (b.contains(mouseX, mouseY)) {
      draggingBlock = b;
      return;
    }
  }
}

function mouseDragged() {
  if (draggingBlock) {
    let newX = draggingBlock.x;
    let newY = draggingBlock.y;

    if (draggingBlock.isHorizontal) {
      newX = (mouseX - blockSize) / blockSize;
    } else {
      newY = (mouseY - blockSize) / blockSize;
    }
    draggingBlock.moveTo(newX, newY);
  }
}

function mouseReleased() {
  draggingBlock = null;
}

// Touch support
function touchStarted() { mousePressed(); return false; }
function touchMoved() { mouseDragged(); return false; }
function touchEnded() { mouseReleased(); return false; }
```

How to Play

1. Objective: Move the Yellow Block to the far right edge.
2. Controls: Click/Tap and drag.
    - Vertical blocks (tall) can only slide up and down.
    - Horizontal blocks (wide) can only slide left and right.

3. The Logic: You must slide the white blocks out of the path of the yellow one to clear the "exit."

Would you like me to add a "Reset" button or generate a second, more difficult level layout for you?

What I Gave to AI:

```
let blockSize = 80;
let blocks = [];
let draggingBlock = null;
let offsetX, offsetY;

function setup() {
  createCanvas(400, 400);

  // 1. The Yellow Block (Goal: Reach the right exit)
  // x, y, width(in cells), height(in cells), color, isHorizontal
  blocks.push(new Block(0, 2, 2, 1, color(255, 255, 0), true, true));

  // 2. Three White Starter Blocks (Strategic but simple placement)
  blocks.push(new Block(2, 0, 1, 2, color(255), false, false)); // Vertical
  blocks.push(new Block(3, 1, 2, 1, color(255), true, false)); // Horizontal
  blocks.push(new Block(4, 3, 1, 2, color(255), false, false)); // Vertical
}

function draw() {
  background(220);
  drawGrid();

  for (let b of blocks) {
    b.display();
  }

  // Check for Win Condition
  if (blocks[0].x >= 3) {
    fill(0, 150, 0);
    textSize(32);
    textAlign(CENTER, CENTER);
    text("LEVEL CLEARED!", width / 2, height / 2);
  }
}

function drawGrid() {
  stroke(200);
  for (let i = 0; i <= width; i += blockSize) {
    line(i, 0, i, height);
    line(0, i, width, i);
```

```
  }
  // Exit Marker
  noStroke();
  fill(255, 200, 0, 100);
  rect(width - 10, 2 * blockSize, 10, blockSize);
}

class Block {
  constructor(x, y, w, h, col, isHorizontal, isTarget) {
    this.x = x; // Grid units
    this.y = y;
    this.w = w;
    this.h = h;
    this.col = col;
    this.isHorizontal = isHorizontal;
    this.isTarget = isTarget;
  }

  display() {
    stroke(0);
    strokeWeight(2);
    fill(this.col);
    rect(
      this.x * blockSize + 5,
      this.y * blockSize + 5,
      this.w * blockSize - 10,
      this.h * blockSize - 10,
      5,
    );
  }

  contains(mx, my) {
    return (
      mx > this.x * blockSize &&
      mx < (this.x + this.w) * blockSize &&
      my > this.y * blockSize &&
      my < (this.y + this.h) * blockSize
    );
  }

  moveTo(nx, ny) {
    // Round to nearest grid slot
    let targetX = round(nx);
    let targetY = round(ny);
```

```
    // Boundary checks
    targetX = constrain(targetX, 0, 5 - this.w);
    targetY = constrain(targetY, 0, 5 - this.h);

    // Collision detection with other blocks
    if (!this.collides(targetX, targetY)) {
      this.x = targetX;
      this.y = targetY;
    }
  }

  collides(tx, ty) {
    for (let other of blocks) {
      if (other === this) continue;
      if (
        tx < other.x + other.w &&
        tx + this.w > other.x &&
        ty < other.y + other.h &&
        ty + this.h > other.y
      ) {
        return true;
      }
    }
    return false;
  }
}

function mousePressed() {
  for (let b of blocks) {
    if (b.contains(mouseX, mouseY)) {
      draggingBlock = b;
      return;
    }
  }
}

function mouseDragged() {
  if (draggingBlock) {
    let newX = draggingBlock.x;
    let newY = draggingBlock.y;

    if (draggingBlock.isHorizontal) {
      newX = (mouseX - blockSize) / blockSize;
```

```
    } else {
      newY = (mouseY - blockSize) / blockSize;
    }
    draggingBlock.moveTo(newX, newY);
  }
}

function mouseReleased() {
  draggingBlock = null;
}

// Touch support
function touchStarted() {
  mousePressed();
  return false;
}
function touchMoved() {
  mouseDragged();
  return false;
}
function touchEnded() {
  mouseReleased();
  return false;
}
```

For this code, organize the code for different pages, block.js, levels.js, index.html, and sketch.js

What AI Gave Me:

To organize your game effectively in VS Code, we'll move from a single "everything" file to a Modular Structure. This keeps your logic separate from your data, making it much easier to add those 6 additional levels without the code becoming a mess.

1. index.html

This is your "entry point." The most important thing here is the order of the scripts. You must load the Block class and the levels data before sketch.js so that the sketch knows they exist.

HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="utf-8">
    <title>Slide Puzzle Game</title>
    <script src="https://cdnjs.cloudflare.com/ajax/libs/p5.js/1.4.0/p5.js"></script>
    <script src="block.js"></script>
    <script src="levels.js"></script>
```

```
  <script src="sketch.js"></script>
</head>
<body>
</body>
</html>
```

---

2. block.js

Move the class Block definition here. This file is now purely a "blueprint" for how blocks behave.

JavaScript

```
class Block {
  constructor(x, y, w, h, col, isHorizontal, isTarget) {
    this.x = x;
    this.y = y;
    this.w = w;
    this.h = h;
    this.col = col;
    this.isHorizontal = isHorizontal;
    this.isTarget = isTarget;
  }

  display() {
    stroke(0);
    strokeWeight(2);
    fill(this.col);
    rect(this.x * blockSize + 5, this.y * blockSize + 5,
        this.w * blockSize - 10, this.h * blockSize - 10, 5);
  }

  contains(mx, my) {
    return (mx > this.x * blockSize && mx < (this.x + this.w) * blockSize &&
          my > this.y * blockSize && my < (this.y + this.h) * blockSize);
  }

  moveTo(nx, ny) {
    let targetX = round(nx);
    let targetY = round(ny);
    targetX = constrain(targetX, 0, 5 - this.w);
    targetY = constrain(targetY, 0, 5 - this.h);

    if (!this.collides(targetX, targetY)) {
      this.x = targetX;
      this.y = targetY;
```

```
    }
  }

  collides(tx, ty) {
    for (let other of blocks) {
      if (other === this) continue;
      if (tx < other.x + other.w && tx + this.w > other.x &&
          ty < other.y + other.h && ty + this.h > other.y) {
        return true;
      }
    }
    return false;
  }
}
```

---

3. levels.js

This is your "database." To add more levels, you just add more objects to this levels array.

JavaScript

```
const levels = [
  {
    // Level 0: Tutorial (The one you already made)
    blocks: [
      { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true, isTarget: true },
      { x: 2, y: 0, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 1, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },
      { x: 4, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }
    ]
  },
  {
    // Level 1: Example of a new challenge
    blocks: [
      { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true, isTarget: true },
      { x: 2, y: 1, w: 1, h: 3, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 2, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false }
    ]
  }
  // Add 5 more here!
];
```

---

4. sketch.js

This file now acts as the "Manager." It handles inputs and switches levels.

JavaScript

```
let blockSize = 80;
let blocks = [];
let draggingBlock = null;
let currentLevel = 0;

function setup() {
  createCanvas(400, 400);
  initLevel(currentLevel);
}

function initLevel(index) {
  blocks = []; // Clear current blocks
  let levelData = levels[index].blocks;

  for (let b of levelData) {
    blocks.push(new Block(b.x, b.y, b.w, b.h, color(b.col), b.isHoriz, b.isTarget));
  }
}

function draw() {
  background(220);
  drawGrid();

  for (let b of blocks) { b.display(); }

  // Check Win Condition
  if (blocks[0].isTarget && blocks[0].x >= 3) {
    fill(0, 150, 0);
    textSize(32);
    textAlign(CENTER, CENTER);
    text("LEVEL CLEARED!", width/2, height/2);

    // Auto-advance to next level after a delay or click
    // Could add: if(mouseIsPressed) { currentLevel++; initLevel(currentLevel); }
  }
}

function drawGrid() {
  stroke(200);
  for (let i = 0; i <= width; i += blockSize) {
    line(i, 0, i, height);
```

```
    line(0, i, width, i);
  }
  fill(255, 200, 0, 100);
  rect(width - 10, 2 * blockSize, 10, blockSize);
}

// Mouse and Touch functions remain the same as your original code...
function mousePressed() { /* ... */ }
function mouseDragged() { /* ... */ }
function mouseReleased() { draggingBlock = null; }
```

Why this is better:

- Independence: If you want to change how a block looks, you only touch block.js.
- Scalability: To add level 3, 4, or 5, you don't even have to look at the "code"—you just add the coordinates to the levels.js list.
- VS Code Friendly: You can keep these tabs open side-by-side to work on the logic and the level design at the same time.

Would you like me to help you design the layout (coordinates) for the next two levels to make them more difficult?

Fei Fei, Gemini, Debugging:

What I Gave AI:
How do I make is so the blocks cant pass the blocks to go on the other side, right now if a block is in the way, some blocks can jump over other blocks

What AI Gave Me:
To ensure your blocks move correctly one grid cell at a time and do not "jump" over obstacles, we need to make sure sketch.js and block.js are perfectly synced.
The issue with blocks not moving usually stems from how the "target" position is calculated in mouseDragged. If the math is slightly off, the moveTo function thinks you haven't moved far enough to reach the next grid cell.

1. The Fixed sketch.js (mouseDragged)

Update your mouseDragged function in sketch.js to this version. It simplifies the input so the block knows exactly which direction you are pulling it.
JavaScript

```
function mouseDragged() {
  if (draggingBlock) {
    // We calculate the raw grid position of the mouse
    let mouseGridX = mouseX / blockSize;
    let mouseGridY = mouseY / blockSize;
```

```
    // We pass these raw values to the block
    draggingBlock.moveTo(mouseGridX, mouseGridY);
  }
}
```

---

2. The Fixed block.js (moveTo)

This version of moveTo compares where the block is now to where your mouse is. If the mouse has moved at least half a block away, it attempts to slide one step.

JavaScript

```
moveTo(nx, ny) {
    // 1. Find the grid cell the mouse is hovering over
    let targetX = floor(nx);
    let targetY = floor(ny);

    if (this.isHorizontal) {
        // If the mouse is to the right of the block's current X
        if (targetX > this.x && !this.collides(this.x + 1, this.y)) {
            if (this.x + this.w < 5) this.x += 1; // Boundary check + move
        }
        // If the mouse is to the left of the block's current X
        else if (targetX < this.x && !this.collides(this.x - 1, this.y)) {
            if (this.x > 0) this.x -= 1; // Boundary check + move
        }
    } else {
        // If the mouse is below the block's current Y
        if (targetY > this.y && !this.collides(this.x, this.y + 1)) {
            if (this.y + this.h < 5) this.y += 1;
        }
        // If the mouse is above the block's current Y
        else if (targetY < this.y && !this.collides(this.x, this.y - 1)) {
            if (this.y > 0) this.y -= 1;
        }
    }
}
```

---

3. Why this works

- Step-by-Step Validation: By using this.x += 1 or this.x -= 1, the block literally cannot skip a square. It checks the collision for the very next square before moving.

- Boundary Integrity: It checks if x + w < 5 (for the right wall) and x > 0 (for the left wall) inside the movement logic to prevent escaping the grid.
- Collision Check: Because it only moves +1 or -1 at a time, it will stop exactly when it hits another block's coordinate.

A Quick Note on the Win Condition

In your sketch.js, you have: if (blocks[0].isTarget && blocks[0].x >= 3)
Make sure that in your levels.js, the Yellow Block is always the first item (index 0) in the blocks array for every level. Otherwise, the game might check if a white block has reached the exit instead!
Would you like me to show you how to add a "Reset Level" button in the corner of the screen?

What I Gave AI:

```
function draw() {
  // 1. Outer background (if canvas is larger than the blue rect)
  background(40);

  // 2. Blue Mobile Device Background
  noStroke(); // Ensure the blue body has no outline
  fill(30, 100, 200);
  rect(0, 0, width, windowHeight);

  // 3. The Light Grey Game Board
  push();
  translate(0, 100);

  // Draw the board background
  noStroke();
  fill(220);
  rect(0, 0, 400, 400);

  // Draw the grid lines (this function will set its own strokes)
  drawGrid();

  // Draw the blocks
  for (let b of blocks) {
    b.display();
  }
  pop(); // Settings reset here, so the next draw loop starts clean

  // Win Condition Check
  if (blocks[0].isTarget && blocks[0].x >= 3) {
    gameCleared = true;
    overlayMessage("TUTORIAL CLEARED!");
  }
```

```
}

function drawGrid() {
  // We explicitly set the stroke for the grid lines
  stroke(200);
  strokeWeight(3);

  // Important: Limit the lines to the 400x400 area
  for (let i = 0; i <= 400; i += blockSize) {
    line(i, 0, i, 400); // Vertical lines
    line(0, i, 400, i); // Horizontal lines
  }

  // Exit Marker
  noStroke();
  fill(255, 200, 0, 100);
  rect(400 - 15, 2 * blockSize, 15, blockSize);
} make the grid centered, and why is there still an outline for the blue mobile?
```

What AI Gave Me:

The reason you are seeing an outline on the blue rectangle is likely because p5.js carries over the stroke() settings from the **previous frame**. Even though you have noStroke() before your blue rect, if the very last thing drawn in the previous frame (like a block) had a stroke, it can sometimes create a "bleeding" edge or a tiny sub-pixel border during the refresh.

To fix the centering and the outline, we will use rectMode(CENTER) for the blue background and ensure the stroke state is strictly reset.

1. Centering the Grid

To center a 400px wide grid on a canvas, we calculate the horizontal offset using (width - 400) / 2.

2. Fixing the Blue Outline

We will move noStroke() to the very top of the draw() loop and ensure that the background() call is clearing the buffer correctly.

Updated sketch.js

JavaScript

```
function draw() {
  // 1. Clear everything and force no stroke for the UI/Background
```

```
  background(40);
  noStroke();

  // 2. Blue Mobile Device Background
  fill(30, 100, 200);
  // Drawing a large rectangle that covers the full width and height
  // Use width and height (not windowHeight) to match the canvas size
  rect(0, 0, width, height);

  // 3. The Light Grey Game Board
  push();
  // Calculate the horizontal center: (Total Width - Grid Width) / 2
  let xOffset = (width - 400) / 2;
  let yOffset = 100;
  translate(xOffset, yOffset);

  // Draw the board background (still no stroke)
  fill(220);
  rect(0, 0, 400, 400);

  // 4. Draw the grid lines
  drawGrid();

  // 5. Draw the blocks
  for (let b of blocks) {
    b.display();
  }
  pop();

  // Win Condition Check
  if (blocks[0].isTarget && blocks[0].x >= 3) {
    gameCleared = true;
    overlayMessage("LEVEL CLEARED!");
  }
}

function drawGrid() {
  // Stroke is only activated here for the lines
  stroke(200);
  strokeWeight(3);

  for (let i = 0; i <= 400; i += blockSize) {
    line(i, 0, i, 400);
    line(0, i, 400, i);
```

```
  }

  // Exit Marker - reset to noStroke so the yellow box has no border
  noStroke();
  fill(255, 200, 0, 150);
  rect(400 - 15, 2 * blockSize, 15, blockSize);
}
```

Why this works

- **xOffset**: By calculating (width - 400) / 2, the grid will always stay in the middle even if you make your createCanvas wider (e.g., createCanvas(600, 800)).
- **noStroke() placement**: By placing noStroke() at the very start of draw(), you are explicitly telling p5.js "start this frame with no outlines."
- **pop()**: Since the drawGrid() function and the Block.display() methods use strokes, pop() throws those settings away so they don't apply to the blue background when the loop starts over.

Important Reminder for mousePressed

Since you have centered the grid horizontally, you must now update your input logic to account for that **X offset** as well.

JavaScript
```
function mousePressed() {
  let xOffset = (width - 400) / 2;
  let adjustedX = mouseX - xOffset;
  let adjustedY = mouseY - 100;

  if (gameCleared) {
    currentLevel++;
    loadLevel(currentLevel % levels.length);
    return;
  }

  for (let b of blocks) {
    if (b.contains(adjustedX, adjustedY)) {
      draggingBlock = b;
      return;
    }
  }
}
```

```
function mouseDragged() {
  if (draggingBlock) {
    let xOffset = (width - 400) / 2;
    let mouseGridX = (mouseX - xOffset) / blockSize;
    let mouseGridY = (mouseY - 100) / blockSize;
    draggingBlock.moveTo(mouseGridX, mouseGridY);
  }
}
```

Would you like me to add a **Level Header** in that blue space at the top that shows the current level name?

What I Gave AI:

```
Remove stroke class Block {
  constructor(x, y, w, h, col, isHorizontal, isTarget) {
    this.x = x;
    this.y = y;
    this.w = w;

```

Remove the dark grey outline on the blue rectangle

What AI Gave Me:

To remove that stubborn dark outline around the blue rectangle, we need to address two things: the JavaScript drawing state and the CSS canvas border.

1. Remove the CSS Border (Most Likely Cause)

If you see an outline that doesn't go away even when you change the code, it is being drawn by your browser via CSS. Look for your index.html file (or your <style> tag) and remove the border property.

Change your CSS to this:

CSS

```
canvas {
  display: block;
  border: none;    /* This removes the CSS outline */
  outline: none;   /* This removes the focus ring */
  margin: 0 auto;
}
```

---

2. The JavaScript "Hard Reset"

In your draw() function, even though you have noStroke(), the very last thing drawn in the previous frame (a block) has stroke(0). This can "leak" into the start of the next frame.

Update your draw() function to include a push/pop around the blue background to isolate it completely:

JavaScript

```
function draw() {
  background(40); // Clear the "desk" area

  // 1. ISOLATE THE BLUE BACKGROUND
  push();
    noStroke();
```

```
    fill(30, 100, 200);
    rect(0, 0, width, height);
  pop(); // This "throws away" the noStroke setting so it doesn't mess with the grid

  // 2. THE GAME BOARD
  push();
    let xOffset = (width - 400) / 2;
    let yOffset = 100;
    translate(xOffset, yOffset);

    noStroke();
    fill(220);
    rect(0, 0, 400, 400);

    drawGrid();

    for (let b of blocks) {
      b.display();
    }
  pop();

  if (gameCleared) {
    overlayMessage("LEVEL CLEARED!");
  }
}
```

---

3. Fix the Input "Dead Zone"

Since you centered your grid with xOffset, your mousePressed and mouseDragged are currently "broken" (you have to click to the left of the blocks to grab them).
Update these two functions to match your new layout:
JavaScript

```
function mousePressed() {
  let xOffset = (width - 400) / 2; // Calculate the same offset used in draw
  let adjustedX = mouseX - xOffset;
  let adjustedY = mouseY - topOffset;

  if (gameCleared) {
    currentLevel++;
    loadLevel(currentLevel % levels.length);
    return;
  }
```

```
  for (let b of blocks) {
    // Now checks the mouse relative to the centered grid
    if (b.contains(adjustedX, adjustedY)) {
      draggingBlock = b;
      return;
    }
  }
}

function mouseDragged() {
  if (draggingBlock) {
    let xOffset = (width - 400) / 2;
    // Align the drag logic with the visual center
    let mouseGridX = (mouseX - xOffset) / blockSize;
    let mouseGridY = (mouseY - topOffset) / blockSize;

    draggingBlock.moveTo(mouseGridX, mouseGridY);
  }
}
```

Would you like me to add a rounded "Home Button" at the bottom of the blue area to make it look even more like a mobile phone?

What I Gave AI:
Make it so it is centered for the whatever screen nit is open on, at the moment the height is not centered

What AI Gave Me:
To center the game board vertically and horizontally regardless of the screen size, you need to calculate a dynamic yOffset based on the windowHeight. Currently, your code uses a hardcoded 100, which keeps it stuck at the top.
I have also included the fix for the dark grey outline. This is usually caused by the browser's default canvas styling or a "leaked" stroke state from a previous frame.

1. Updated sketch.js (The Logic)

Replace your draw, mousePressed, and mouseDragged functions with the code below. This uses windowHeight to ensure the 400px grid is always in the mathematical center.
JavaScript

```
function draw() {
  // 1. Hard reset to remove any potential outlines/strokes
  noStroke();
  background(40);

  // 2. Blue Mobile Device Background (Full Screen)
  fill(30, 100, 200);
```

```
  rect(0, 0, width, height);

  // 3. Center the Game Board
  push();
  // Calculate dynamic offsets for perfect centering
  let xOffset = (width - 400) / 2;
  let yOffset = (height - 400) / 2; // Centers vertically based on screen height
  translate(xOffset, yOffset);

  // Draw the board background (light grey)
  noStroke();
  fill(220);
  rect(0, 0, 400, 400);

  drawGrid();

  for (let b of blocks) {
    b.display();
  }
  pop();

  if (gameCleared) {
    overlayMessage("LEVEL CLEARED!");
  }
}

// --- Updated Input Handling for Centering ---

function mousePressed() {
  // We must use the same dynamic offsets as the draw function
  let xOffset = (width - 400) / 2;
  let yOffset = (height - 400) / 2;

  let adjustedX = mouseX - xOffset;
  let adjustedY = mouseY - yOffset;

  if (gameCleared) {
    currentLevel++;
    loadLevel(currentLevel % levels.length);
    return;
  }

  for (let b of blocks) {
    if (b.contains(adjustedX, adjustedY)) {
```

```
      draggingBlock = b;
      return;
    }
  }
}

function mouseDragged() {
  if (draggingBlock) {
    let xOffset = (width - 400) / 2;
    let yOffset = (height - 400) / 2;

    let mouseGridX = (mouseX - xOffset) / blockSize;
    let mouseGridY = (mouseY - yOffset) / blockSize;

    draggingBlock.moveTo(mouseGridX, mouseGridY);
  }
}
```

2. Remove the "Grey Outline" (CSS Fix)

The "dark grey stroke" you are seeing is almost certainly a CSS border on the canvas element. To remove it, ensure your index.html (or your CSS file) contains this specific style:

CSS

```
canvas {
  display: block;
  border: none !important;  /* Removes the grey outline */
  outline: none !important; /* Removes the focus ring */
  box-shadow: none;        /* Removes any outer glow */
}
```

3. Responsive Setup

In your setup() function, make sure you are using windowWidth and windowHeight so the blue background actually fills the entire browser window:

JavaScript

```
function setup() {
  // This makes the blue area fill the entire browser window
  createCanvas(windowWidth, windowHeight);
  loadLevel(currentLevel);
}

// This ensures the game centers itself if you resize the browser window
function windowResized() {
  resizeCanvas(windowWidth, windowHeight);
}
```

Would you like me to help you add a Score Counter or a Move Limit to the blue area above the grid?

What I Gave AI:

If I want to add instructions to only the tutorial how can I do that and where? let blockSize = 80;

```
let blocks = [];
let draggingBlock = null;
let currentLevel = 0;
let gameCleared = false;

function setup() {
  createCanvas(500, windowHeight);
  loadLevel(currentLevel);
}

function loadLevel(idx) {
  blocks = [];
  gameCleared = false;
  let data = levels[idx].blocks;
  for (let b of data) {
    blocks.push(
      new Block(b.x, b.y, b.w, b.h, color(b.col), b.isHoriz, b.isTarget),
    );
  }
}

function draw() {
  noStroke();
  background(40);

  fill(30, 100, 200);
  rect(0, 0, width, height);

  push();
  let xOffset = (width - 400) / 2;
  let yOffset = (height - 400) / 2;
  translate(xOffset, yOffset);

  fill(220);
  rect(0, 0, 400, 400);

  drawGrid();
```

```
  for (let b of blocks) {
    b.display();
  }
  pop();

  if (blocks[0].isTarget && blocks[0].x >= 3) {
    gameCleared = true;

    if (currentLevel === 0) {
      overlayMessage("TUTORIAL CLEARED!");
    } else {
      overlayMessage("LEVEL " + currentLevel + " CLEARED!");
    }
  }
}

function drawGrid() {
  // Stroke is only activated here for the lines
  stroke(200);
  strokeWeight(3);

  for (let i = 0; i <= 400; i += blockSize) {
    line(i, 0, i, 400);
    line(0, i, 400, i);
  }

  // Exit Marker - reset to noStroke so the yellow box has no border
  noStroke();
  fill(255, 200, 0, 150);
  rect(400 - 14, 2 * blockSize, 15, blockSize);
}

function overlayMessage(msg) {
  fill(0, 150);
  rect(0, 0, width, height);
  fill(255);
  textSize(32);
  textAlign(CENTER, CENTER);
  text(msg, width / 2, height / 2);
  textSize(16);
  text("Click to continue", width / 2, height / 2 + 40);
}

// --- Input Handling ---
```

```
let topOffset = 100;

function mousePressed() {
  // We must use the same dynamic offsets as the draw function
  let xOffset = (width - 400) / 2;
  let yOffset = (height - 400) / 2;

  let adjustedX = mouseX - xOffset;
  let adjustedY = mouseY - yOffset;

  if (gameCleared) {
    currentLevel++;
    loadLevel(currentLevel % levels.length);
    return;
  }

  for (let b of blocks) {
    if (b.contains(adjustedX, adjustedY)) {
      draggingBlock = b;
      return;
    }
  }
}

function mouseDragged() {
  if (draggingBlock) {
    let xOffset = (width - 400) / 2;
    let yOffset = (height - 400) / 2;

    let mouseGridX = (mouseX - xOffset) / blockSize;
    let mouseGridY = (mouseY - yOffset) / blockSize;

    draggingBlock.moveTo(mouseGridX, mouseGridY);
  }
}

function mouseReleased() {
  draggingBlock = null;
}

// Touch support stays the same as it calls the updated mouse functions
function touchStarted() {
  mousePressed();
```

```
  return false;
}
function touchMoved() {
  mouseDragged();
  return false;
}
function touchEnded() {
  mouseReleased();
  return false;
}
```

What AI Gave Me:

Since your tutorial is currentLevel 0, you can use the same logic we used for the win message. The best place to put this is in the draw() function, right after you draw the blue background but before the push() for the grid.

This way, the instructions appear in the blue area at the top of the "mobile screen."

1. Update the draw() function

Add this block of code inside your draw() function:

JavaScript

```
function draw() {
  noStroke();
  background(40);

  // Blue Mobile Device Background
  fill(30, 100, 200);
  rect(0, 0, width, height);

  // --- ADD INSTRUCTIONS HERE ---
  if (currentLevel === 0 && !gameCleared) {
    fill(255); // White text
    textAlign(CENTER, CENTER);
    textSize(18);
    // Position it in the blue space above the grid
    text("Drag the yellow block to the exit!", width / 2, 60);
  }
  // ------------------------------

  push();
  let xOffset = (width - 400) / 2;
```

```
let yOffset = (height - 400) / 2;
translate(xOffset, yOffset);
// ... rest of your code
```

2. Why this works

- **The if condition:** It checks currentLevel === 0 so it only shows up during the tutorial. It also checks !gameCleared so the text disappears once the player wins, preventing it from overlapping with your "TUTORIAL CLEARED" message.
- **Placement:** By putting it before push() and translate(), the coordinates are based on the whole screen. width / 2 centers it horizontally, and 60 puts it near the top.

3. Making it look even better

If you want to add a second line of instructions (like "Vertical blocks move up/down"), you can just add another text() line below the first one:

JavaScript
```
if (currentLevel === 0 && !gameCleared) {
  fill(255);
  textAlign(CENTER, CENTER);
  textSize(20);
  text("TUTORIAL", width / 2, 40);
  textSize(14);
  text("Slide the blocks to clear a path.", width / 2, 70);
}
```

Would you like me to show you how to add an "arrow" icon next to the exit marker during the tutorial to make it even more obvious where to go?

Fei Fei, Gemini, Level 1

What I Gave AI:
To add an additional level, you primarily need to update your levels.js file by adding a new object to the levels array. Because the sketch.js file is designed to load levels based on their index in that array, the game will automatically recognize the new content.

What AI Gave Me:

1. Update levels.js

Add a new curly-bracket object {...} to the end of your array. Each level needs a title and a blocks array containing the coordinates for every piece.

JavaScript

```
// levels.js
const levels = [
  { /* Tutorial data... */ },
  { /* Level 1 data... */ },
  {
    title: "Level 2: The Narrow Path",
    blocks: [
      // The Target Block (Yellow)
      { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true, isTarget: true },
      // Add obstacles (White)
      { x: 2, y: 0, w: 1, h: 3, col: [255], isHoriz: false, isTarget: false },
      { x: 3, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false }
    ]
  }
];
```

---

2. Key Parameters to Define

When placing your blocks, remember how the Block class interprets these numbers:

- x & y: These are grid units (0 to 4), not pixels.
- w & h: The width and height in grid cells (e.g., a w: 2, h: 1 block occupies two horizontal squares).
- isHoriz: This boolean (true or false) locks the block's movement to either the X or Y axis.
- isTarget: Only one block (usually the yellow one at y: 2) should have this set to true to trigger the win condition.

3. Verification in sketch.js

Your sketch.js is already set up to advance the currentLevel variable when the target block reaches the exit. As long as you have added the object to levels.js, the following logic in sketch.js handles the transition:

- It checks if currentLevel is less than levels.length.
- It calls loadLevel(currentLevel), which clears the old blocks and loops through your new level data to create new Block objects.

Would you like me to provide the specific coordinates for a more difficult "Level 2" layout?

Ivy, Gemini, Home page

Prompt: Use this existing code I created for the homepage of this game and add a play button that takes the user to the tutorial once it is clicked

```
let gameState = "home"; // "home" or "game"
let playBtn = { x: 0, y: 0, w: 200, h: 60 };

function drawHome() {
  background(40);

  noStroke();
  fill(30, 100, 200);
  rect(0, 0, width, height);

  // Title
  fill(255);
  textAlign(CENTER, CENTER);
  textSize(40);
  textStyle(BOLD);
  text("Let Me Out!", width / 2, height * 0.3);
```

Response:

To integrate a working **Play Button** that transitions from your home screen to the tutorial, we need to handle the button's coordinates and add a click detection logic in the mousePressed() function.

Here is the updated code based on your snippets and the existing logic:

1. Updated home.js

This script manages the "home" state and uses the logic from sketch.js once the game starts.

JavaScript

```
let gameState = "home"; // "home" or "game"
let playBtn = { x: 0, y: 0, w: 200, h: 60 };

function drawHome() {
  background(40);

  noStroke();
  fill(30, 100, 200);
  rect(0, 0, width, height);
```

```
  // Title
  fill(255);
  textAlign(CENTER, CENTER);
  textSize(40);
  textStyle(BOLD);
  text("Let Me Out!", width / 2, height * 0.3);

  // Set Play Button Position
  playBtn.x = width / 2 - playBtn.w / 2;
  playBtn.y = height * 0.55;

  // Check if mouse is hovering for visual feedback
  let isHovering = mouseX > playBtn.x && mouseX < playBtn.x + playBtn.w &&
                   mouseY > playBtn.y && mouseY < playBtn.y + playBtn.h;

  // Draw Button
  stroke(255);
  strokeWeight(2);
  fill(isHovering ? 50 : 30, 120, 220); // Slightly change color on hover
  rect(playBtn.x, playBtn.y, playBtn.w, playBtn.h, 10);

  // Button Text
  noStroke();
  fill(255);
  textSize(24);
  text("PLAY", width / 2, playBtn.y + playBtn.h / 2);
}

// Global p5 functions to manage state
function setup() {
  createCanvas(500, 800); // Ensures height matches your game setup
  loadLevel(0); // Preloads the Tutorial level
}

function draw() {
  if (gameState === "home") {
    drawHome();
  } else {
    runGame(); // Calls the drawing logic in sketch.js
  }
}

function mousePressed() {
  if (gameState === "home") {
```

```
    // Check if the Play Button was clicked
    if (mouseX > playBtn.x && mouseX < playBtn.x + playBtn.w &&
        mouseY > playBtn.y && mouseY < playBtn.y + playBtn.h) {
      gameState = "game"; // Transitions to the Tutorial
    }
  } else {
    handleGameMousePressed(); // Calls the input logic in sketch.js
  }
}
```

2. Required Adjustments to sketch.js

To avoid function name conflicts, you must rename the main functions in your sketch.js so home.js can call them:

1. **Rename draw() to runGame()**.
2. **Rename mousePressed() to handleGameMousePressed()**.
3. **Remove the setup()** function inside sketch.js since it is now handled in home.js.

---

3. Check Script Order in index.html

Make sure sketch.js is loaded **before** home.js so that the functions are available when the state changes.

HTML
```
<script src="block.js"></script>
<script src="levels.js"></script>
<script src="sketch.js"></script>
<script src="home.js"></script>
```

Would you like me to help you create a specific "How to Play" instruction overlay for the home screen as well?

Jeane, ChatGPT, Level 2

What was given:

(the base files was also attached)

Design Level 2 for a 5×5 sliding block puzzle game inspired by Rush Hour, where the goal is to move a specific target block to the right-side exit by reaching column 3 or beyond. All blocks can only move along their set orientation, cannot overlap, and the level must be fully solvable with a logical path, no guessing and no dead ends. This level should feel like a noticeable step up from Level 1, both in puzzle complexity and movement difficulty, but it should still feel fair and clear. The layout should require at least 4 to 6 meaningful moves before the target can escape, including at least one moment where the player has to move something away first in order to reposition another block that eventually clears the path. The grid should feel tighter and more constrained, but not overcrowded or visually confusing. Alongside the puzzle design, movement should start to feel slightly heavier to reflect the theme of progressive muscular dystrophy. Add moderate drag resistance and, if included, a very rare hesitation effect that happens occasionally but not often enough to feel random or broken. The frustration should come from the growing effort and planning required, not from unpredictability. When presenting the level, include the full block configuration in the { x, y, w, h, horizontal, isTarget } format, a clear step-by-step solution to prove it is solvable, confirmation that there are no irreversible deadlocks, and suggested values for dragFactor and stutterProb that make the difficulty increase noticeable but still manageable.

What was generated:

Alright. Level 2 needs to feel tighter, smarter, slightly annoying in a deliberate way, but not evil. No guessing. No fake difficulty. Just controlled friction.

We're still on a 5×5 grid. Coordinates are 0-indexed. Exit is to the right, and the target must reach column 3 or beyond (so its left x ≥ 3 if width = 2).

🔹 Level 2 – Block Configuration

```
[
  { x: 1, y: 2, w: 2, h: 1, horizontal: true,  isTarget: true  },  // Target block

  { x: 3, y: 1, w: 1, h: 2, horizontal: false, isTarget: false },  // Vertical blocker (main gate)
  { x: 0, y: 0, w: 2, h: 1, horizontal: true,  isTarget: false },
  { x: 2, y: 0, w: 1, h: 2, horizontal: false, isTarget: false },
  { x: 0, y: 3, w: 3, h: 1, horizontal: true,  isTarget: false },  // Forces reposition logic
  { x: 4, y: 2, w: 1, h: 2, horizontal: false, isTarget: false }
]
```

🧩 What This Layout Does

- The target sits in row 2.

- The vertical block at (3,1) is directly blocking its exit.
- That blocker cannot move down immediately because the tall block at (4,2) and the wide block at (0,3) restrict space.
- Player must shift space elsewhere before unlocking the gate.
- Grid feels tighter than Level 1, but readable.

✅ Step-by-Step Logical Solution

Minimum meaningful sequence:

1. Move bottom wide block (0,3) → right to (1,3)
Creates breathing room in column 0.

2. Move vertical block at (4,2) → down to (4,3)
This frees row 2 alignment space.

3. Move vertical blocker at (3,1) → down to (3,2)
Now the exit column begins clearing.

4. Move blocker again → down to (3,3)
Path is now open on row 2.

5. Slide target right from (1,2) → (2,2)

6. Slide target right from (2,2) → (3,2)
Target reaches column 3 → escape condition met.

Total: 6 meaningful moves.
Includes forced indirect move chain.
No guessing. Each step visibly opens space.

🔒 Deadlock Check

- No block can be pushed into a corner that permanently traps the board.
- The vertical gate at (3,1) always has downward escape once space is created.
- No configuration allows overlapping trap cycles.
- All blockers have at least one directional recovery path.

So yes. Fully solvable. No irreversible states introduced by the solution path.

💪 Movement Difficulty Scaling

Level 2 should feel heavier, not broken.

Suggested values:

```
dragFactor = 0.18     // Level 1 was ~0.08–0.10
stutterProb = 0.05    // 5% chance of slight hesitation
```

How it should feel:

- Blocks require slightly more sustained drag.
- Momentum dies faster.
- Very rare micro-pause (~80ms) before continuing.
- Happens occasionally enough to be noticed, not enough to feel random.

Frustration should feel like:
"I need to push harder."

Not:
"The game is glitching."

🎯 Why This Works as Level 2

- Exit is no longer directly solvable.
- Introduces vertical gate logic.
- Introduces chained repositioning.
- Grid is tighter but not cluttered.
- Movement now has weight.

It's a clear escalation from Level 1, but still fair.

If you want, Level 3 can start introducing partial fake-outs and double-gate logic. That's where it starts feeling mentally heavy too.

What was given:

So what should I do to integrate the code to the main file?

What was generated:

You don't replace your whole game. You just swap the block configuration inside whatever function initializes the level. If your Level 1 is currently hardcoded inside setup() or initLevel(), then Level 2 is simply a different block array plugged into the same logic.

Think structure like this:

```
function loadLevel(levelNumber) {
  if (levelNumber === 1) {
    blocks = [ /* Level 1 config */ ];
  }

  if (levelNumber === 2) {
    blocks = [ /* Level 2 config */ ];
    dragFactor = 0.18;
    stutterProb = 0.05;
  }
}
```

Then in setup():

```
loadLevel(2);
```

Also, important: if your movement physics currently doesn't support dragFactor and stutterProb, adding the level alone won't magically create the heavier feel. Those variables need to actually be used inside your dragging logic.

If you want, show me how your level initialization currently looks and I'll tell you exactly where Level 2 plugs in cleanly.

What was given:

The blocks should be slightly more difficult to move, a bit more difficult to solve so think like increasing the amount of blocks, but solvable

What was generated:

Bet. Here's a Level 2 that's more crowded than Level 1, still clean, and 100% solvable with your current movement + collision rules. Also included a tiny "heavier movement" tweak you can paste in so Level 2 feels tougher to drag without making it feel broken.

1) Paste this into levels.js as your new Level 2

Keep the target as the first block because your win check still uses blocks[0].

```
{
  title: "Level 2: Moderate",
  blocks: [
    // Target (must stay first)
    { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true, isTarget: true },

    // Top horizontal that blocks moving the x=2 blocker upward until you shift it
    { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    // Main blocker on the target lane (x=2, y=2). Must move up to clear.
    { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

    // Blocks x=3 lane for the target. Must move up twice to clear x=3, y=2.
    { x: 3, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

    // Blocks x=4 lane for the target. Must move down to clear x=4, y=2.
    { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },

    // This blocks the x=4 vertical from moving down until you move it left
    { x: 3, y: 4, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    // Filler block to tighten the board a bit (doesn't deadlock anything)
    { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true, isTarget: false },

    // More filler to increase constraint, still fair
    { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false },
  ],
},
```

2) Proof it’s solvable (solution path)

1. Move the bottom-right horizontal block at (3,4) left to (2,4)
2. Move the vertical block at (4,1) down twice until it sits at (4,3)
3. Move the vertical block at (3,2) up twice until it sits at (3,0)
4. Move the top horizontal block at (1,0) left to (0,0)
5. Move the vertical block at (2,1) up to (2,0)
6. Slide the target block right three times to reach x = 3 and win

No overlaps, no illegal moves, no “pray it works” steps.

3) Make Level 2 feel heavier to drag (minimal code tweak)

Right now blocks can move every frame while dragging, which feels super “snappy.” For Level 2, add a tiny cooldown so each move needs a bit more effort.

In block.js, inside the constructor, add:

```
this.cooldownUntil = 0;
```

Then at the top of moveTo(nx, ny) add:

```
if (frameCount < this.cooldownUntil) return;

// very rare hesitation on Level 2 only (kept low so it doesn't feel buggy)
if (currentLevel === 2 && random(1) < 0.006) return;
```

And after each successful move (right after this.x += 1, this.x -= 1, this.y += 1, this.y -= 1) add:

```
if (currentLevel === 2) this.cooldownUntil = frameCount + 3;
```

That’s it. Level 2 will feel a bit more stubborn without becoming “my mouse died” simulator.

If you want, send me your planned Level 3 vibe (more blockers vs more dependency chain) and I’ll build Level 3 so it’s harder but still fair.

Jolin, (AI USED), Level 4 & 5

Design Level 4 for a 5×5 sliding block puzzle inspired by Rush Hour. The goal of the puzzle is to move the target block to the right-side exit, which happens once the block reaches column 3 or further. All blocks can only move in the direction of their orientation (horizontal or vertical), cannot overlap with each other, and the level must be fully solvable through logical moves, with no guessing or dead ends.

This level should feel like a step up from Levels 1 and 2 in terms of puzzle complexity and movement difficulty, but it should still feel **fair and easy to understand** for the player. The layout should require at least 5–6 meaningful moves before the target block can escape. There should also be at least one moment where the player has to move one block out of the way first in order to reposition another block, which eventually helps clear the path for the target. The grid should feel a bit tighter and more constrained than the earlier levels, encouraging more careful planning, but it shouldn’t feel overcrowded or visually

confusing. To reflect the theme of progressive muscular dystrophy, the movement in this level should start to feel slightly heavier. Add moderate drag resistance, and if included, a very rare hesitation (stutter) effect that happens occasionally but not often enough to feel random or broken. The frustration of the level should come from the extra effort and planning required, not from unpredictable mechanics. When presenting the level, include the full block configuration using the format
{ x, y, w, h, horizontal, isTarget }
a clear step-by-step solution to show that the puzzle is solvable, confirmation that there are no irreversible deadlocks, and suggested values for dragFactor and stutterProb that make the difficulty increase noticeable but still manageable.

(base files attached)

Here's a **fresh Level 4** designed specifically for **your current codebase** and your Level 2/3 style:

- **Tighter** than Level 3 (more pieces, less freedom)
- Needs **at least 5–6 meaningful moves** (this one is ~11 moves)
- Has a clear dependency moment: **you must move one block first to reposition another, which then frees the lane**
- **No irreversible deadlocks** (everything is reversible in your move system)
- Includes suggested **dragFactor / stutterProb** + the tiny code edits to apply them

---

Level 4 block configuration (requested format)

{ x, y, w, h, horizontal, isTarget }

```
[
 { x: 0, y: 2, w: 2, h: 1, horizontal: true,  isTarget: true  }, // Target

 { x: 2, y: 1, w: 1, h: 2, horizontal: false, isTarget: false }, // A (blocks 2,2)
 { x: 3, y: 1, w: 1, h: 2, horizontal: false, isTarget: false }, // B (blocks 3,2)
 { x: 4, y: 1, w: 1, h: 2, horizontal: false, isTarget: false }, // C (blocks 4,2)

 { x: 3, y: 0, w: 2, h: 1, horizontal: true,  isTarget: false }, // D (top gate)
 { x: 0, y: 0, w: 2, h: 1, horizontal: true,  isTarget: false }, // E (left cap)
 { x: 1, y: 4, w: 2, h: 1, horizontal: true,  isTarget: false }, // F (bottom cap)
 { x: 0, y: 3, w: 1, h: 2, horizontal: false, isTarget: false }, // G (left constraint)
```

]

Drop-in Level 4 object for your levels.js

Paste this **after Level 3** and **before** the final];

```
{
 title: "Level 4: Gate Lock",
 blocks: [
   // Target (keep first)
   { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true,  isTarget: true },

   // Exit-lane blockers
   { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // A
   { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // B
   { x: 4, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // C

   // Gate + caps that force sequencing
   { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // D (top gate)
   { x: 0, y: 0, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // E (left cap)
   { x: 1, y: 4, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // F (bottom cap)
   { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // G (left constraint)
 ],
},
```

Step-by-step solution (proof it's solvable)

Goal: clear row y=2 at x=2,3,4, then slide target to x >= 3.

1. Move **D left**: (x 3 → 2)

2. Move **D left**: (x 2 → 1)

3. Move **D left**: (x 1 → 0)
   ✅ This frees top cells (3,0) and (4,0) so B/C can move up.

4. Move **B up**: (y 1 → 0) ✅ clears (3,2)

5. Move **C up**: (y 1 → 0) ✅ clears (4,2)

Now A is still blocking (2,2), but A can't go up (space is taken), so you must move it **down**:

6. Move **A down**: (y 1 → 2) *(still blocks (2,2))*
7. Move **A down**: (y 2 → 3) ✅ clears (2,2)

Now the entire lane is open:

8. Target right (0 → 1)
9. Target right (1 → 2)
10. Target right (2 → 3) ✅ escape

10 meaningful moves, with a clear dependency chain: **gate first → lift B/C → drop A → exit**.

Design Level 5 for a 5×5 sliding block puzzle inspired by Rush Hour. The goal of the puzzle is to move the target block to the right-side exit, which happens once the block reaches column 3 or further. All blocks can only move in the direction of their orientation (horizontal or vertical), cannot overlap with each other, and the level must be fully solvable through logical moves, with no guessing or dead ends.

This level should feel like a step up from Levels 3 and 4 in terms of puzzle complexity and movement difficulty, but it should still feel **fair and easy to understand** for the player. The layout should require at least 5–6 meaningful moves before the target block can escape. There should also be at least one moment where the player has to move one block out of the way first in order to reposition another block, which eventually helps clear the path for the target. The grid should feel a bit tighter and more constrained than the earlier levels, encouraging more careful planning, but it shouldn't feel overcrowded or visually confusing. To reflect the theme of progressive muscular dystrophy, the movement in this level should start to feel slightly heavier. Add moderate drag resistance, and if included, a very rare hesitation (stutter) effect that happens occasionally but not often enough to feel random or broken. The frustration of the level should come from the extra effort and planning required, not from unpredictable mechanics. When presenting the level, include the full block configuration using the format
{ x, y, w, h, horizontal, isTarget }
a clear step-by-step solution to show that the puzzle is solvable, confirmation that there are no irreversible deadlocks, and suggested values for dragFactor and stutterProb that make the difficulty increase noticeable but still manageable.

(base files were attached)

Here's a **hard Level 5** that's a clear step up from your Level 4 "Double Unlock": it adds a **three-stage unlock chain** (top cap → free A, bottom bar → free B, then a gate → finally free C), while still being **fair, readable, and solvable**.

Level 5 block configuration (requested format)

{ x, y, w, h, horizontal, isTarget }

```
[
 { x: 0, y: 2, w: 2, h: 1, horizontal: true,  isTarget: true  }, // Target

 { x: 2, y: 1, w: 1, h: 2, horizontal: false, isTarget: false }, // A blocks (2,2)
 { x: 3, y: 1, w: 1, h: 2, horizontal: false, isTarget: false }, // B blocks (3,2)
 { x: 4, y: 2, w: 1, h: 2, horizontal: false, isTarget: false }, // C blocks (4,2)

 { x: 3, y: 0, w: 2, h: 1, horizontal: true,  isTarget: false }, // D top gate
 { x: 1, y: 0, w: 2, h: 1, horizontal: true,  isTarget: false }, // E top cap (must move first)
 { x: 2, y: 4, w: 2, h: 1, horizontal: true,  isTarget: false }, // F bottom bar (must move)
 { x: 1, y: 3, w: 2, h: 1, horizontal: true,  isTarget: false }, // G mid shelf (forces sequencing)
 { x: 0, y: 3, w: 1, h: 2, horizontal: false, isTarget: false }  // H left constraint
]
```

Drop-in levels.js object (matches your schema)

Paste this **after Level 4** and before the final];:

```
{
 title: "Level 5: Triple Unlock (Hard)",
 blocks: [
   // Target (keep first)
   { x: 0, y: 2, w: 2, h: 1, col: [255, 255, 0], isHoriz: true,  isTarget: true },

   // Exit-lane blockers
   { x: 2, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // A
   { x: 3, y: 1, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // B
   { x: 4, y: 2, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // C

   // Top area: must clear to allow A + later gate moves
   { x: 3, y: 0, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // D gate
   { x: 1, y: 0, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // E cap
```

```
  // Bottom area: must clear to allow B to drop twice
  { x: 2, y: 4, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // F bottom bar
  { x: 1, y: 3, w: 2, h: 1, col: [255], isHoriz: true,  isTarget: false }, // G mid shelf

  // Constraint
  { x: 0, y: 3, w: 1, h: 2, col: [255], isHoriz: false, isTarget: false }, // H
 ],
},
```

Step-by-step solution (proves solvable)

Goal: clear row y=2 at x=2,3,4, then slide target to x >= 3.

Phase 1 — Free A (top cap dependency)

1. Move **E left** (x 1 → 0) ✅ frees (2,0)
2. Move **A up** (y 1 → 0) ✅ clears (2,2)

Phase 2 — Make room to drop B (bottom chain)

3. Move **F left** (x 2 → 1) ✅ opens (3,4)
4. Move **G left** (x 1 → 0) ✅ opens (2,3) and changes what's blocked below B
5. Move **B down** (y 1 → 2) *(still blocks (3,2))*
6. Move **B down** (y 2 → 3) ✅ clears (3,2)

Phase 3 — Clear C (final gate dependency)

C needs to move down from y=2 → 3, but it's blocked unless the mid shelf has shifted (that's why G had to move).

7. Move **C down** (y 2 → 3) ✅ clears (4,2)

Exit

8. Target right (0 → 1)
9. Target right (1 → 2)
10. Target right (2 → 3) ✅ escape

10 meaningful moves, and it's not just "move everything up/down"—it's **three distinct unlocks**.

Confirmation: no irreversible deadlocks

- All pieces only slide on one axis and can always be moved back as long as space exists (your game has no one-way mechanics).
- The "unlock" moves (E, F, G) are reversible; none of them can be pushed into a position that permanently traps the target lane.
- Even if the player moves B/C in the wrong order, they can backtrack because nothing becomes permanently blocked.

So: **no irreversible deadlocks**.
